

How to Create a Winning SIH 2026 PPT

Complete Day 2 Guide • SIH 2026

Your PPT is not a document. It is your argument for why your solution deserves to win. A strong solution can still lose if the evaluator cannot quickly understand the problem, solution, innovation, feasibility and impact.

Part A: Evaluation Criteria

Judges score every team on these five criteria. Build each slide so it earns marks on at least one of them.

Criteria	Weight	What judges look for
Innovation	25%	Originality of the idea and approach
Impact	25%	Size and importance of the problem solved, benefit to real users
Feasibility	20%	Can it realistically be built, adopted and sustained
Technical Execution & Demo	20%	Working prototype, quality of implementation
Presentation	10%	Clarity of pitch, teamwork, Q&A

Takeaway: Innovation and Impact together carry 50% of the marks, so slides 3 and 7 of your deck deserve the most polish. Feasibility and Technical Execution carry another 40%, which is why a working prototype (slide 6) matters.

Part B: The Guide

01 - The Golden Rule

Don't make your PPT complicated. Make it easy to understand.

- What problem are you solving?
- Who has this problem?
- Why does it matter?
- What exists today?
- What is missing?
- What are you proposing?
- What makes it different?
- How does it work?
- Can you build it?
- What impact will it create?
- Can it scale?

02 - Build the Story Before Designing

PROBLEM > CURRENT SYSTEM > GAP > PROPOSED SOLUTION > USP / INNOVATION > WORKFLOW > TECHNOLOGY > PROTOTYPE > FEASIBILITY > IMPACT > SCALABILITY

Do not open Canva or PowerPoint first. Build the story first.

03 - Keywords > Paragraphs

Use short phrases, keywords, numbers, icons and labels instead of long paragraphs.

AI ENGINE • REAL-TIME DATA • PREDICTION • GIS • ALERTS

04 - Workflow

INPUT > PROCESS > OUTPUT

DATA > PROCESSING > AI ENGINE > DECISION > USER ACTION

05 - Symmetry & Alignment

- Consistent margins
- Equal spacing
- Aligned elements
- Consistent card sizes
- Consistent font hierarchy
- Consistent icon sizing

Use: Grid > Align > Distribute > Repeat

06 - Diagrams & Visuals

If something can be explained visually, use a diagram instead of a paragraph.

USER > APP > API > BACKEND > AI ENGINE > DATABASE > RESULT

07 - Infographics

Use infographics for numbers, comparisons and measurable results. **Never invent numbers.**

BEFORE: 60 min > AFTER: 25 min (only if validated)

08 - Flowcharts

DATA RECEIVED > RISK DETECTED? > NO: MONITOR / YES: ALERT > ACTION

Workflow shows how a system operates; flowchart shows decisions and logic.

09 - Impact

USER > PROBLEM > SOLUTION > CHANGE > IMPACT

- Who benefits?
- What improves?
- How does it improve?
- How will you measure it?

10 - Feasibility

Feasibility = Can we actually build it?

- **Technical:** software, hardware, AI/ML, APIs, sensors and infrastructure.
- **Data:** source, access and responsible simulation.
- **Operational:** can the real user use it?
- **Cost:** development, hardware, deployment and maintenance.

11 - Viability

Feasibility = Can we build it?

Viability = Can it work sustainably in the real world?

USER NEED > VALUE > ADOPTION > DEPLOYMENT > SUSTAINABILITY > SCALE

12 - One Slide = One Question

Every slide should have one primary question.

Slide	Question
1	What are we solving?
2	Why does this problem matter?
3	What exists today?
4	What is missing?
5	What are we proposing?
6	Why is our solution different?
7	How does it work?
8	Can we actually build it?
9	What have we built?
10	What impact will it create?
11	How can it scale?
12	Why is this team capable?

13 - Recommended SIH PPT Structure

Slide	Main Question	Content
01	Why this problem?	Problem + Evidence + Impact
02	Why existing solutions aren't enough?	Existing System + Gap
03	What are we proposing?	Solution + USP
04	How does it work?	Workflow + User Journey + Tech
05	Can it actually work?	Prototype + Feasibility + Impact
06	Why should it scale?	Scalability + Team + Final Impact

14 - Visual Hierarchy

- **Level 1:** Main message
- **Level 2:** Supporting point
- **Level 3:** Evidence

Think: BIG MESSAGE > SUPPORTING IDEA > PROOF.

15 - Common PPT Mistakes

- Paragraph-heavy slides
- Too many technologies used as a substitute for innovation
- Claiming no solution exists without research
- Architecture that nobody understands
- No prototype or evidence
- Invented or unrealistic metrics
- Too many features
- Poor alignment
- No scalability story
- No backup demo

16 - The 3-Minute Evaluator Test

Give the PPT to someone who knows nothing about your project. Ask:

- What problem are we solving?
- Who is the user?
- What does our solution do?
- What makes it different?
- Why would someone use it?

If they cannot answer these questions, simplify the story.

17 - Final Checklist

- Problem clear
- User identified
- Existing system researched
- Gap established
- Solution addresses gap
- USP obvious
- Workflow visual
- Architecture understandable
- Prototype demonstrated
- Feasibility proven
- Impact measurable
- Scalability realistic
- Visual consistency
- One question per slide
- No unnecessary features
- No fake statistics
- Backup demo ready
- Every member can explain the project

18 - The Final Formula

KEYWORDS > WORKFLOW > SYMMETRY > DIAGRAMS > INFOGRAPHICS > IMPACT > FEASIBILITY > VIABILITY > PROOF

Part C: Your 8-Slide Plan Mapped to the Criteria

The guide's slide structure, adapted to 8 slides and linked to the evaluation criteria so every slide earns marks.

#	Slide	Main question	What goes on it	Criteria it earns
1	Problem	What are we solving, and why does it matter?	Problem statement, who is affected, 1-2 sourced evidence points	Impact
2	Existing System & Gap	What exists today, and what is missing?	2-3 current solutions, what they miss, gap in one line	Innovation, Impact
3	Proposed Solution & USP	What are we proposing, and why is it different?	One-line solution, 3-4 core features, USP highlighted	Innovation
4	Workflow & User Journey	How does it work?	Input > Process > Output diagram, short user journey	Technical Execution, Presentation
5	Technology & Architecture	What is it built on?	Architecture diagram, tech stack as keywords, one decision flowchart	Technical Execution, Feasibility
6	Prototype & Feasibility	What have we built, and can we actually build it?	Screenshots or demo link, technical / data / operational / cost cards	Technical Execution, Feasibility
7	Impact & Viability	What changes, and can it last?	User > Problem > Solution > Change > Impact, measurement, adoption, sustainability	Impact, Feasibility
8	Scalability & Team	Can it grow, and why is this team capable?	Roadmap (pilot, state, national), scaling approach, team roles	Feasibility, Presentation

Apply on every slide: keywords and diagrams over paragraphs; Big Message > Supporting Point > Proof; consistent grid and card sizes; only validated numbers; backup demo ready for slide 6.
